No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 496, Application US/09198452A
Patent No. 6559294
GENERAL INFORMATION:
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, preve
TITLE OF INVENTION: and treatment of infection
FILE REPERENCE: 9710-003-999
CURRENT FILING DATE: 1998-11-24
NUMBER OF SEQ ID NOS: 6849

The invention relates to novel therapeutic compounds, that are designed to chanace binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and immunomodulatory. The compounds are useful against human ovarian cancer, for modulating immune response in a subject, and for generating cancer vacinism that especifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of anti-cancer vacinism and to expand immune effector cells that are specific for cancer vacinism do expand immune effector cells that are specific for cancer vacinism and to expand immune effector cells that are specific for cells characterised by expression of antigen EIP3 (melanoma antigen cells characterised by expression of antigen EIP3 (melanoma antigen a detectable agent may be used in diagnostic procedures, such as in the production of antibodies. The polyhucleotides can be used as primers for detecting genes or gene transcripts expressed in APC to confirm cansulation of the polyhucleotides and election elections and elections elections and elections of human cancer antigen eIP3 (corresponds to residues 242-250 of ABB08360)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Aiding in the diagnosis of a neoplastic condition, useful for treating cancer and related malignancies comprises determining the amount of expression of an eIF3 protein in a test sample isolated from the cell or

The invention relates to aiding in the diagnosis of a neoplastic condition or susceptibility to a neoplastic condition of an animal cell or tissue. The method involves determining the amount of expression of an eukaryotic translation initiation factor 3 (eIP3) protein in a test sample isolated from the cell or tissue, and diagnosing a neoplastic condition or susceptibility to a neoplastic condition based on the amount

of expression of the eIF3 protein. The methods, compounds and kits are useful in therapeutics, diagnostic and screening methods for human cancer and related malignancies, e.g. overtian, breast, lung, colon, prostate, pancreatic or gastrointestinal cancer, or melanoma. The present sequence represents the human antigen eIF3 epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; prostate cancer; prostate cancer antigen; detection; diagnosis; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder; wound; infectious disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, valnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polymucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat glasorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel complex between two interacting proteins listed within the specification. The complex of the invention demonstrates anti-HIV activity whilst the SID (selected interacting domains) and polypeptides may be useful for screening molecules that inhibit human immunodeficiency virus (HIV), as well as during gene therapy procedures. The siRNAs (silencing RNAs) targeted against cellular proteins interacting with HIV-1 integrase, LEDGF, MCM7, HBO1, Snurportin, VBP1, Transportin-SR and EIFS3, are useful in preparing a medicament for treating HIV-1. The current sequence is that of the human SID protein of

The invention relates to a novel complex between two interacting proteins listed within the specification. The complex of the invention demonstrates anti-HIV activity whilst the SID (selected interacting domains) and polypeptides may be useful for screening molecules that inhibit human immunodeficiency virus (HIV), as well as during gene therapy procedures. The siRNAs (silencing RNAs) targeted against cellular proteins interacting with HIV-1 integrase, LEDGF, MCM7, HBO1, Snurportin, VBP1, Transportin-SR and BIFS3, are useful in preparing a medicament for treating HIV-1. The current sequence is that of the human SID protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; melanoma antigen eukaryotic initiation factor 3; eIF3; ovarian cancer; MHC; cytostatic; immunomodulator; immune effector cell; anti-cancer; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel therapeutic compounds, that are designed to enhance binding to MHC molecules and to enhance immunoregulatory properties relative to their natural counterparts. The activity of the compounds of the invention may be described as cytostatic and compounds of the invention may be described as cytostatic and confounds. The compounds are useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules. Compositions comprising the compounds are useful as components of antibodies that expression of antigen BIF3 (mellanome antigen of cancer vaccines and to expand immune effector cells that are specific for cancer vaccines and to expand immune effector cells that are specific for cancer vaccines and to expand immune effector cells that are specific for cancer vaccines and to expand immune effector cells that are specific for cancer vaccines and to expand immune effector cells that are specific for cancer vaccines and tested and in the detection and purification of antibodies. The poptiales or polypeptides conjugated to detecting genes or gene transcripts expressed in APC to confirm transduction of the polynucleotides into host cells. The current sequence correctly and antigen eukaryotic initiation factor 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New therapeutic compounds useful against human ovarian cancer, for modulating immune response in a subject, and for generating antibodies that specifically recognize and bind to these molecules.

                    condition or succeptibility to a neoplastic condition of an animal cell or tissue. The method involves determining the amount of expression of an extractoric translation intitation factor 3 (e1f3) protein in a test sample isolated from the cell or tissue, and diagnosing a neoplastic condition or susceptibility to a neoplastic condition based on the amount of expression of the eIF3 protein. The methods, compounds and kits are useful in therapeutics, diagnostic and screening methods for human cancer and related malignancies, e.g. ovarian, breast, lung, colon, prostate, pancreatic or gastrointestinal cancer, or melanoma. The present sequence represents the human antigen eIF3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Leber's hereditary optic neuropathy; LHON; mitochondrial encephalopathy lactic acidosis and stroke; MELAS; mitochondrial encephalopathy lactic acidosis and stroke; MELAS; moclonic epilepsy rasged red fibre syndrome; MERRF; cancer; neuropactective; noctropic; antidiabetic; anticonvulsant; antiarthritic; osteopathic; ophthalmological; cytostatic.

                                                                                                                                                                                                                                                                                                                                       This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC3089) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to mucleic acid sequences over 99% identical with invention also relates to mucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; an antibody against a polypeptide of the invention, an antibody against a polypeptide of the invention, and methods of identifying a compound which binds to a polypeptide of the invention. The identifying a compound which binds to a polypeptide of the invention. The identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of polypeptide of the invention. The invention is methods for the identification of compounds that modulate the and/or monoclonal antibodies for carrying out the methods of the invention of compounds that modulate the appression or activity of the polymelectical and/or polypeptide invention or activity of the polymelectical and/or polypeptide invention or activity of the polymelectical and/or polypeptide invention are contig sequences corresponding to the cDNA sequences of the invention are identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and other neurodegenerative diseases, namemia, placelete traits, and other neurodegenerative diseases, anaemia, placelete conters. The nucleic acids may also be used as hybridisation probes or primers, and other neurodegenerating antibodical as molecular weight markers, and as food supplements. The present sequence represents a specification, but chained human polypeptide sequence of the invention. Note: The sequence of the invention of abcellation, but a f

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide comprises one of the 5602
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
cligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprises a 1'-end sequence, where the
oligonucleotide which comprises a 1'-end sequence, where the
oligonucleotide comprises at least 15 nucleotides and the combination of
the 5'-end sequence(3'-end sequence is selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
gene therapy. The primers are useful for synthesiahing polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
compression and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers are also useful for the
connection and/or diagnosis of the abnormality of the full-length
cDNAs easily without any specialised methods. AAH31362 to AAH3322
represent human amino acid sequences; and AAH3322 to AAH3322 ceptesent
connection and out the exemplification of the
                                                                                                                                                                                                                                                                         Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untramslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forenalic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Regulatory protein; HRGP; human; cell proliferation; immune response; cancer; adenocarcinoma; leukemia; lymphoma; melanoma; myeloma; sarcoma; tetracarcinoma; Addison's disease; adult respiratory distress syndrome; allergy; anemia; astham; atherosclerosis; bronchitis; cholecystitus; crohn's disease; ulcerative colitis; atopic dermatitis; dermatomyositis; diabetes mellitus; emphysema; atrophic gastritis; glomerulonephritis; gout; Grave's disease; hyperainophillia; irritable bowel syndrome; AIDS; lupus erythematosus; multiple sclerosis; myasthemia gravis; infarction; osteoarthitis; osteoprosis; pancreatitis; polymyositis; hemodialysis; arthritis; scleroderma; Sjoegren's syndrome; and autoimmune thyroiditis;
